

# ECE 391 Discussion

## Week 10

# Announcements & Reminders

- ▶ Exam 2 is next Tuesday, November 6<sup>th</sup> at 7pm
  - ▶ Room assignments TBA
  - ▶ TWO sheets of notes (front and back). No devices/calculators!
  - ▶ Conflict? Notify the Professors by Friday, November 2<sup>nd</sup> at 5pm
  - ▶ Review session TBD
- ▶ MP3.3 due November 12<sup>th</sup> at 6pm
- ▶ Plan accordingly!

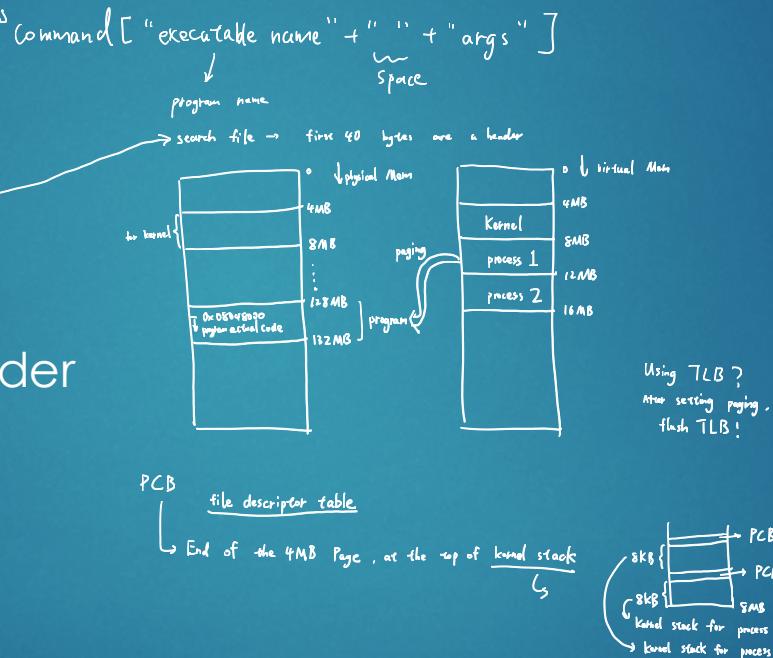

# System Calls

- ▶ System calls
  - ▶ Support 10 (numbered 1-10)
  - ▶ CP3: Execute, halt, open, close, read, write
  - ▶ CP4: The rest
- ▶ Parameters (convention)
  - ▶ EAX – system call number
  - ▶ EBX – 1<sup>st</sup> arg
  - ▶ ECX – 2<sup>nd</sup> arg
  - ▶ EDX – 3<sup>rd</sup> arg
  - ▶ Return value in EAX (not all calls return)
- ▶ All system calls must be supported via a common IDT entry → Need generic assembly linkage

# Execute

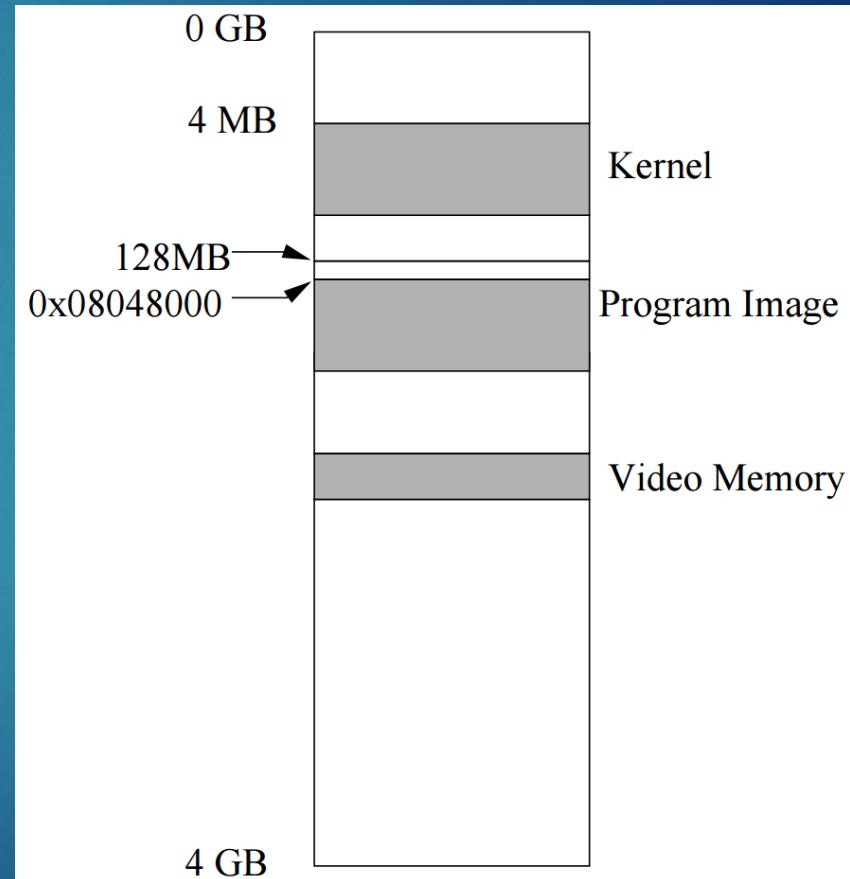

- ▶ Execute
- ▶ Parse
- ▶ Executable check
- ▶ Paging
- ▶ User-level Program Loader
- ▶ Create PCB
- ▶ Context Switch

int32\_t execute( const uint8\_t \* command )

# Paging and Program Loader

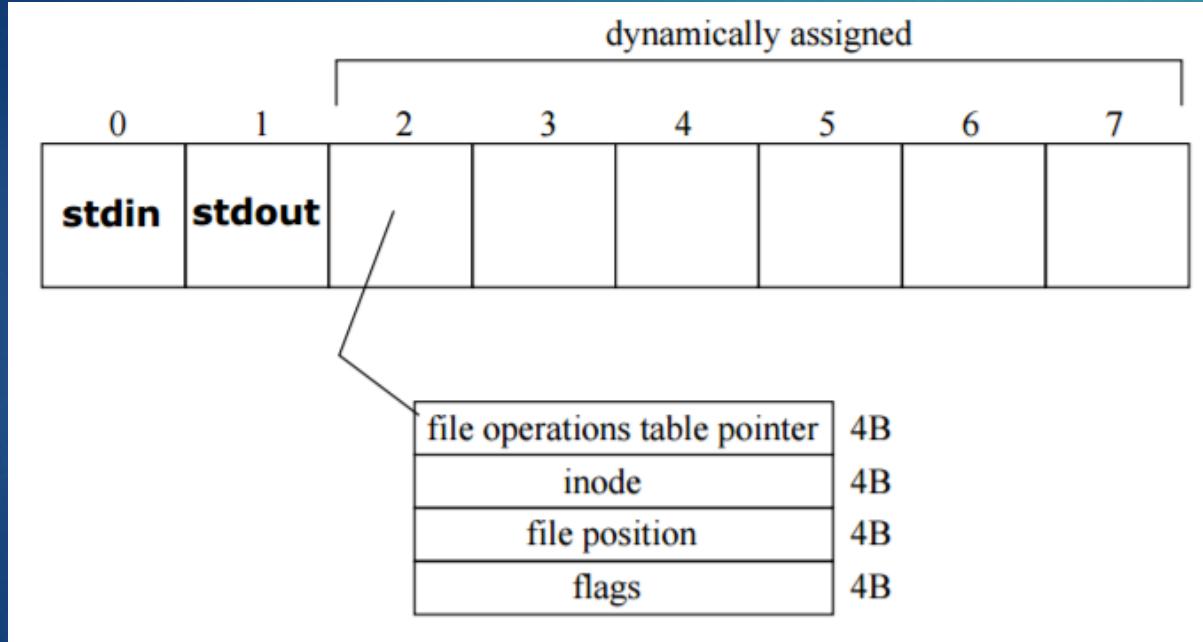

- ▶ All user level programs will be loaded in the page starting at 128MB (virtual mem)
- ▶ Physical memory starts at  $8\text{MB} + (\text{process number} * 4\text{MB})$   
process number starts from 0
- ▶ Flush TLB after swapping page
- ▶ Program loader
  - ▶ Checks ELF magic constant
  - ▶ Copy file contents to the correct location
  - ▶ Find the first instruction's address

# Process Control Block (PCB)

- ▶ Each process has its own PCB
- ▶ Each PCB starts at the top of a 8KB block inside the kernel
  - ▶ First PCB starts at 8MB – 8KB
  - ▶ Second PCB starts at 8MB – 8KB – 8KB
  - ▶ ...
- ▶ Switch the kernel stack when switching PCB
- ▶ What you need in a PCB
  - ▶ File descriptor array
  - ▶ Whatever you think is necessary for running/stopping a program and should be process specific

# File Descriptor Table

- ▶ File descriptor
  - ▶ integer index into this array
  - ▶ how user programs identify the open file
- ▶ Up to 8 open files per task
- ▶ Stores structures containing:
  - ▶ Pointer to file operations jump table
  - ▶ Inode
  - ▶ File position
  - ▶ Flags

# System Calls (contd.)

- ▶ Open
  - ▶ Find the file in the file system and assign an unused file descriptor
  - ▶ File descriptors need to be set up according to the file type
- ▶ Close
  - ▶ Close the file descriptor passed in (set it to be available)
  - ▶ Check for invalid descriptors
- ▶ Read, write
  - ▶ Use file operations jump table to call the corresponding read or write function
  - ▶ The real functionality should be no longer than 1 line

# Now we combine everything
